

CS-GO

Computer Science Growth & Opportunities

Where Students and Businesses Grow Together

Good afternoon.

We are a group of Computer Science students from South East Technological University, and through CS-GO — Computer Science Growth & Opportunities — we want to create a bridge between students and local businesses.

What makes this project different is that we already have most of what is needed to start:

- motivated students,
- technical skills,
- equipment,
- and a strong willingness to create something socially useful while gaining real industry experience.

We are not mainly looking for funding.

What we are looking for is support in building connections.

We would greatly value support from Local Enterprise Office Waterford in helping us communicate with small businesses and community organisations that need digital support but may not know where to begin.

Our approach is volunteer-based. Students can help create websites, databases, booking systems, online shops, and other digital tools completely free while gaining something even more valuable — real experience, teamwork skills, communication with real clients, and professional reputation before graduation.

We believe this reputation-first approach is extremely important. Our first goal is not immediate profit, but creating a trusted ecosystem connecting students, organisations, and future employers. Once this community grows, it can naturally evolve into recruitment partnerships, premium business services, AI-powered education tools, and long-term industry collaboration.

We would also appreciate support in coordinating with South East Technological University management to help create a dedicated working space where students can:

- meet with organisations,

- collaborate on projects,
- present completed work,
- and build a professional innovation environment inside the university.

We believe that with the right ecosystem and support, students can create real value for the local community while becoming far more prepared for future careers.

CS-GO is not only a student project.

It is the beginning of a long-term innovation community connecting education, technology, and local business growth.
